Common brain disorders are associated with heritable patterns of apparent aging of the brain

Common risk factors for psychiatric and other brain disorders are likely to converge on biological pathways influencing the development and maintenance of brain structure and function across life. Using structural MRI data from 45,615 individuals aged 3–96 years, we demonstrate distinct patterns of apparent brain aging in several brain disorders and reveal genetic pleiotropy between apparent brain aging in healthy individuals and common brain disorders.

Boosting Schizophrenia Genetics by Utilizing Genetic Overlap With Brain Morphology

Dennis van der Meer • Alexey A. Shadrin • Kevin O'Connell • ... Ole A. Andreassen • Oleksandr Frei • Tobias Kaufmann • Show all authors

Open Access • Published: February 11, 2022 • DOI: <https://doi.org/10.1016/j.biopsych.2021.12.007>

Methods We ran a multivariate genome-wide analysis of 175 brain morphology measures using data from 33,735 participants of the UK Biobank and analyzed the results in a conditional false discovery rate together with schizophrenia genome-wide association study summary statistics of the Psychiatric Genomics Consortium (PGC). We subsequently created a pleiotropy-enriched polygenic score based on the loci identified through the conditional false discovery rate approach and used this to predict schizophrenia in a Norwegian clinical cohort of 743 individuals with schizophrenia and 1074 healthy controls.
